AI-use disclosure

Prepared supporting statement, 26 October 2026

Manuscript: The minimum number of distinct abelian squares in a binary circular word.

Author: Deep Bhattacharjee.

Claude (Anthropic), used through Claude Code under the author's direction, assisted with the original proof, Lean formalisation, checking programs, figures and manuscript. OpenAI Codex assisted with the present source audit, checks of the theorem statements, finite-case verification and conversion to amsart.

The mathematical proof body and the Lean sources are preserved from the recorded repository commit. Exact verification evidence and its scope accompany the package. No AI system is listed as an author.

The published Hexagon declaration records that some parts, but not all, have been checked and understood by a human. That declaration has not been upgraded automatically. Lean checking and finite computations do not certify human understanding.

The Electronic Journal of Combinatorics requires authors using AI-obtained proofs to rewrite them in their own words and vouch for every step. The author must personally satisfy and confirm that requirement before submission.

This is a prepared disclosure, not an official journal form, signature or attestation that all submission requirements have been met.
